

Status Log Information

The AHERA monitor is required to do a visual inspection of the facilities in the fall and in the spring to determine the status/condition of the asbestos containing material in the buildings. This site specific status log lists the various buildings, and where, and how much, asbestos containing materials remains. The monitor should correct any errors they see and also add, and delete when asbestos has been newly discovered, or been abated. This form should be sent to the Property & Construction Office after the spring inspection. A copy of this form is kept in the AHERA binder.
